

## +🚀 Step 1: Setup (Creating Users & Assigning Incorrect Permissions)

### 1 Create users (user1 & user2)

```
File Actions Edit View Help
(kali@kali)-[~]
$ sudo useradd user1
sudo passwd user1
sudo useradd user2
sudo passwd user2
[sudo] password for kali:
New password:
Retype new password:
passwd: password updated successfully
New password:
Retype new password:
passwd: password updated successfully
```

#### Explanation:

- `sudo useradd -m -s /bin/bash user1`
    - `sudo` → Runs the command with root privileges.
    - `useradd` → Creates a new user.
    - `-m` → Creates a home directory for the user.
    - `-s /bin/bash` → Sets the default shell for the user to Bash.
    - `user1` → The name of the new user.
  - `sudo passwd user1` → Sets a password for `user1`. The system will prompt for a new password.
  - The same process is repeated for `user2`.
- 

### 2 Give full access to `/etc/shadow` (Misconfiguration)

```
(kali@kali)-[~]
$ sudo chmod 777 /etc/shadow
sudo chmod 777 /etc/passwd

(kali@kali)-[~]
$
```

#### Explanation:

- `chmod` → Changes file permissions.
  - `777` → Gives full read (`r`), write (`w`), and execute (`x`) permissions to **everyone** (owner, group, and others).
  - `/etc/shadow` → This file stores hashed passwords for system accounts. Making it world-readable is a major security risk.
- 

### 3 Verify incorrect permissions

```
(kali@kali)-[~]  
$ ls -l /etc/shadow  
-rwxrwxrwx 1 root shadow 1656 Mar 17 10:03 /etc/shadow
```

#### Explanation:

`ls -l` → Lists files in long format, displaying permissions, owner, group, and other details.

The output should show `-rwxrwxrwx`, meaning all users have full access to `/etc/shadow`.

---

## Step 2: Exploitation (Accessing Sensitive System Files)

### 4 Switch to `user1` (Low-privileged user)

#### Explanation:

- `su - user1` → Switches to `user1` and loads its environment.
  - Normally, `user1` should not have access to sensitive system files, but due to the misconfiguration, it can now exploit the vulnerability.
- 

### 5 Try reading `/etc/shadow` (Exploit)

```
—$ su - user1
Password:
—(user1@kali)~]
—$ cat /etc/shadow

user2:$y$j9T$7iKGysBFevMloFzK0aIBA1$dScpsd0EPHYVq5h1EEIiKGs27d6iydZAw4sJ6.rME11:20164:0:99999:7:::
user1:$y$j9T$0qyXxnZZLMq05HptaRWNg/$E6g16H5vT7uxe1KjCJWHIibnhyvJn9VLDJlmEjj3p88:20164:0:99999:7:::
```

### Explanation:

- `cat /etc/shadow` → Attempts to display the contents of the shadow file.
  - If permissions are misconfigured (777), `user1` will successfully read hashed passwords, which is a major security issue.
- 

## Step 3: Mitigation (Fixing the Security Issue)

### 6 Exit `user1` and switch back to Kali user

```
(user1@kali)-[~]  
$ exit  
logout
```

### Explanation:

- `exit` → Logs out of `user1` and returns to the previous user session.
- 

### 7 Restore correct file permissions

```
(kali@kali)-[~]  
$ sudo chmod 640 /etc/shadow  
sudo chown root:shadow /etc/shadow
```

### Explanation:

- `chmod 640 /etc/shadow`
    - `640` → Sets permissions to **read & write (rw-)** for root, **read-only (r--)** for the **shadow group**, and **no access (---)** for others.
    - This prevents unauthorized users from reading or modifying the file.
  - `chown root:shadow /etc/shadow`
    - `chown` → Changes file ownership.
    - `root:shadow` → Sets the owner as `root` and the group as `shadow`.
    - This ensures that only root and the shadow group can access the file.
- 

### 8 Verify permissions are fixed

```
(kali@kali)-[~]  
$ ls -l /etc/shadow  
-rw-r----- 1 root shadow 1656 Mar 17 10:03 /etc/shadow
```

### Explanation:

- Checks if `/etc/shadow` now has the correct permissions (`-rw-r-----`).
- 

### 9 Ensure `user1` is now denied access

```
(kali㉿kali)-[~]  
$ su - user1  
cat /etc/shadow  
Password:  
(user1㉿kali)-[~]  
$ cat /etc/shadow  
cat: /etc/shadow: Permission denied
```

### Expected Output:

```
(kali㉿kali)-[~]  
$ su - user1  
cat /etc/shadow  
Password:  
(user1㉿kali)-[~]  
$ cat /etc/shadow  
cat: /etc/shadow: Permission denied
```

### Explanation:

- Since permissions were fixed, `user1` is now correctly denied access.
